

# Shell Scripting Tasks

---

Create a folder named `scripts` in this repository having tasks in it.

```
scripts/  
  task1.sh  
  task2.sh  
  .  
  .  
  .  
  taskn.sh
```

## Task 1

---

Write a script to search a file in a given folder.

```
~$ ./task1.sh <search_file> <from_folder>
```

For example:

```
./task1.sh file1 folder1/
```

Should output searching every single occurrence of `file1` by using depth first search.

## Task 2

---

Write a utility script to follow a deployment pipeline

1. First it should create three files in `task2/` folder created earlier in present working directory
2. Create three files using `touch` command inside the `task2/` folder
3. Copy the files and paste into another created folder named `task2_temp/`
4. Swap both folder names
5. `echo` before each step what is happening in the next line
6. Make this script `task2.sh` executable
